

Design Basics - Maintaining responsiveness

- Aditya Kumar
Chief Technology Officer, edwisor.com

We will cover with the following concepts

- 1) Things to keep in mind while checking basic responsiveness
- 2) Solution to various problems related to responsiveness

We need to keep a close eye on few problems and make sure we solved them in our code

- **Problem of pinch zoom** - Solve this by setting the viewport correctly.
- **Problem of horizontal scrolling** - Solve this by using relative sizing and positioning instead of absolute.
- **Problem of elements not resizing properly on different screen sizes** - Solve this by using media queries and handling various screen sizes.
- **Readable font and resized images and videos on different screen sizes** - Solve this by using media queries and handling various screen sizes.
- **Responsive layout** - Solve this by using flexbox layouts

We will learn by applying things to a page one by one

- I have created a simple webpage using HTML and CSS which is not responsive yet.
- We will change the page one by one to make it responsive step by step.

Next Steps -

- 1) Problem of pinch zoom
